Ordered self-assembled nanocrystal promise novel physical properties due to collective effects and provide a cost effective way to fabricate macro-scale devices that rely on the peculiar properties of their individual components

Why nanocrystals?

- Collective effects
- Cost effective way for macroscale devices
- Linearly polarized emission
- Orientation dependent conductivity

Arrays of dot/ rod core-shell CdSe/ CdS nanorods

Nanocrystals and light

- Red-shift and broadening of longitudinal-optical (LO) phonon peak due to confinement effects
- Surface-optical (SO) phonon modes were found to depend on the aspect ratio of the nanorods

Calculated displacement pattern of the breathing mode of a 1.4 nm diameter CdSe nanowire

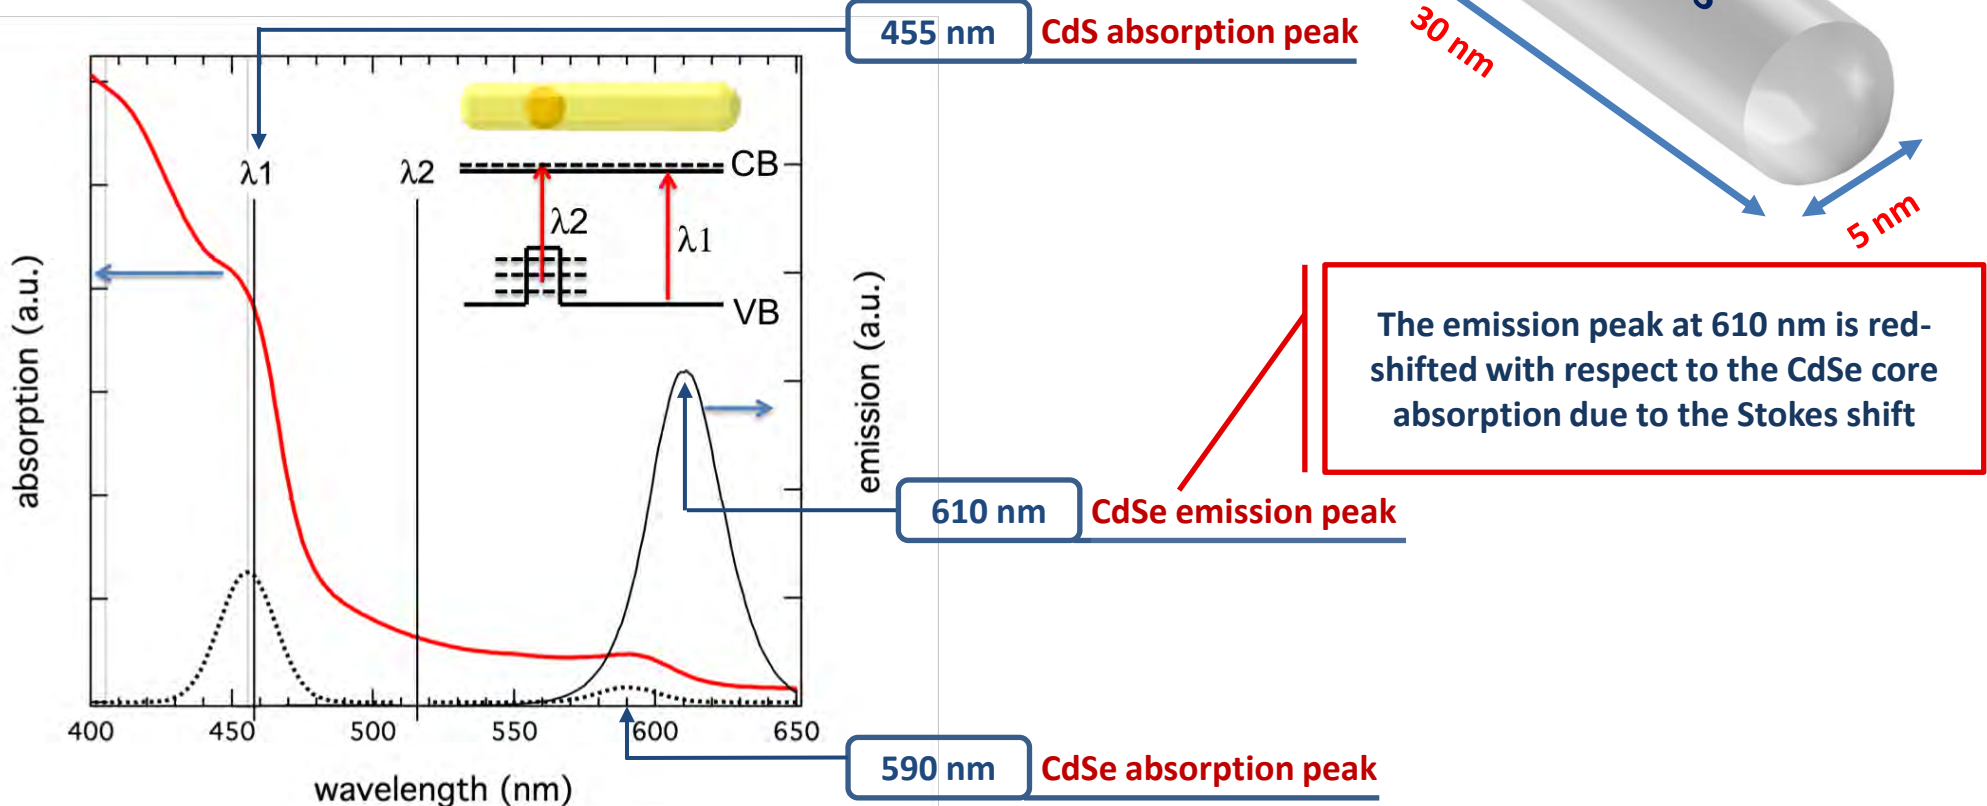

H. Lange *et al.* Nano Lett. (2008)

- Radial breathing modes have been observed both in spherical and rod-shaped nanocrystals
- Linearly polarized Raman experiments on oriented arrays of CdSe nanorods allowed to distinguish LO phonon modes oscillating parallel and perpendicular to the nanorod axis

Characterization of CdS/CdSe nanorods

Optical Absorption and Emission spectra

At the excitation wavelength $\lambda_1=458$ nm the Raman signal is in resonance with the transitions in the nanorod shell (CdS), while at $\lambda_2=514$ nm it is in resonance with transitions related to excited states in the CdSe core

Raman spectroscopy on nanorods' tracks

Standard Raman Spectroscopy

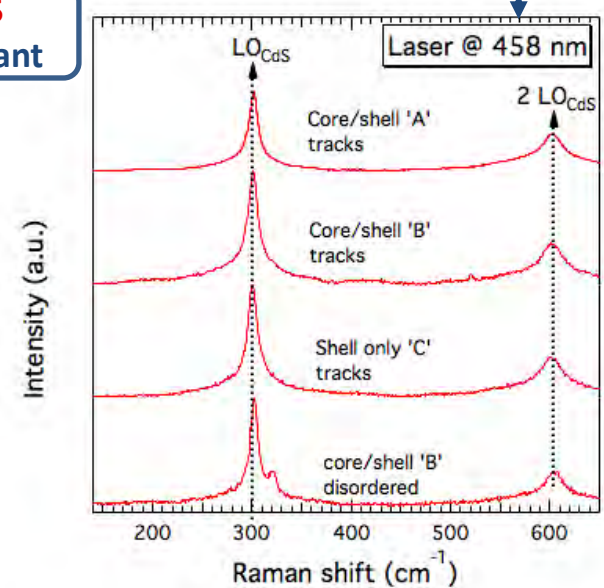

Broad Raman peak at 295 cm^{-1}

Only observed if:

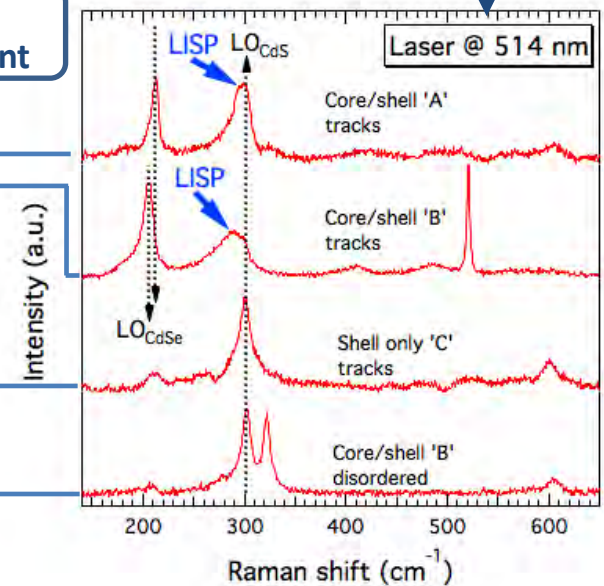

- Nanorods are assembled into a **superlattice**
- Excitation wavelength in **resonance** with the excited states of the CdSe core

CdS resonant

CdSe resonant

The broad LISP peak was in resonance with electronic transitions of the CdSe core. Since this mode is only observed in spectra from the nanorod tracks, we can attribute its origin to a super-lattice effect

Proposed grating coupling effect

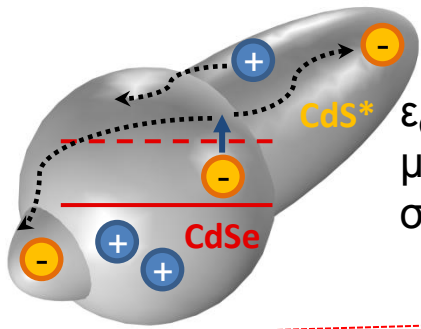

We propose that a grating coupler effect is produced by photo-induced charges localized in the vicinity of the CdSe cores

Our 2D COMSOL model assumed the charge distribution of the photo-generated electrons was approximated by an elliptical area, and the holes were confined in the spherical CdSe core region

Design and Materials

$$\begin{aligned} \epsilon_{\text{surf}} &= 2.25 \\ \mu_{\text{surf}} &= 1 \\ \sigma_{\text{surf}} &= 10 \cdot 10^{-12} \text{ [S/m]} \end{aligned}$$

Surfactant

$$\begin{aligned} \epsilon_{\text{CdS}^*} &= 8.28 \\ \mu_{\text{CdS}^*} &= 1 \\ \sigma_{\text{CdS}^*} &= \text{Charge dependent} \end{aligned}$$

CdS*

$$\begin{aligned} \epsilon_{\text{CdSe}} &= 9.29 \\ \mu_{\text{CdSe}} &= 1 \\ \sigma_{\text{CdSe}} &= \text{Charge dependent} \end{aligned}$$

CdSe

CdS

$$\begin{aligned} \epsilon_{\text{CdS}} &= 8.28 \\ \mu_{\text{CdS}} &= 1 \\ \sigma_{\text{CdS}} &= 2.81 \cdot 10^{-4} \text{ [S/m]} \end{aligned}$$

Outer domain/
PML

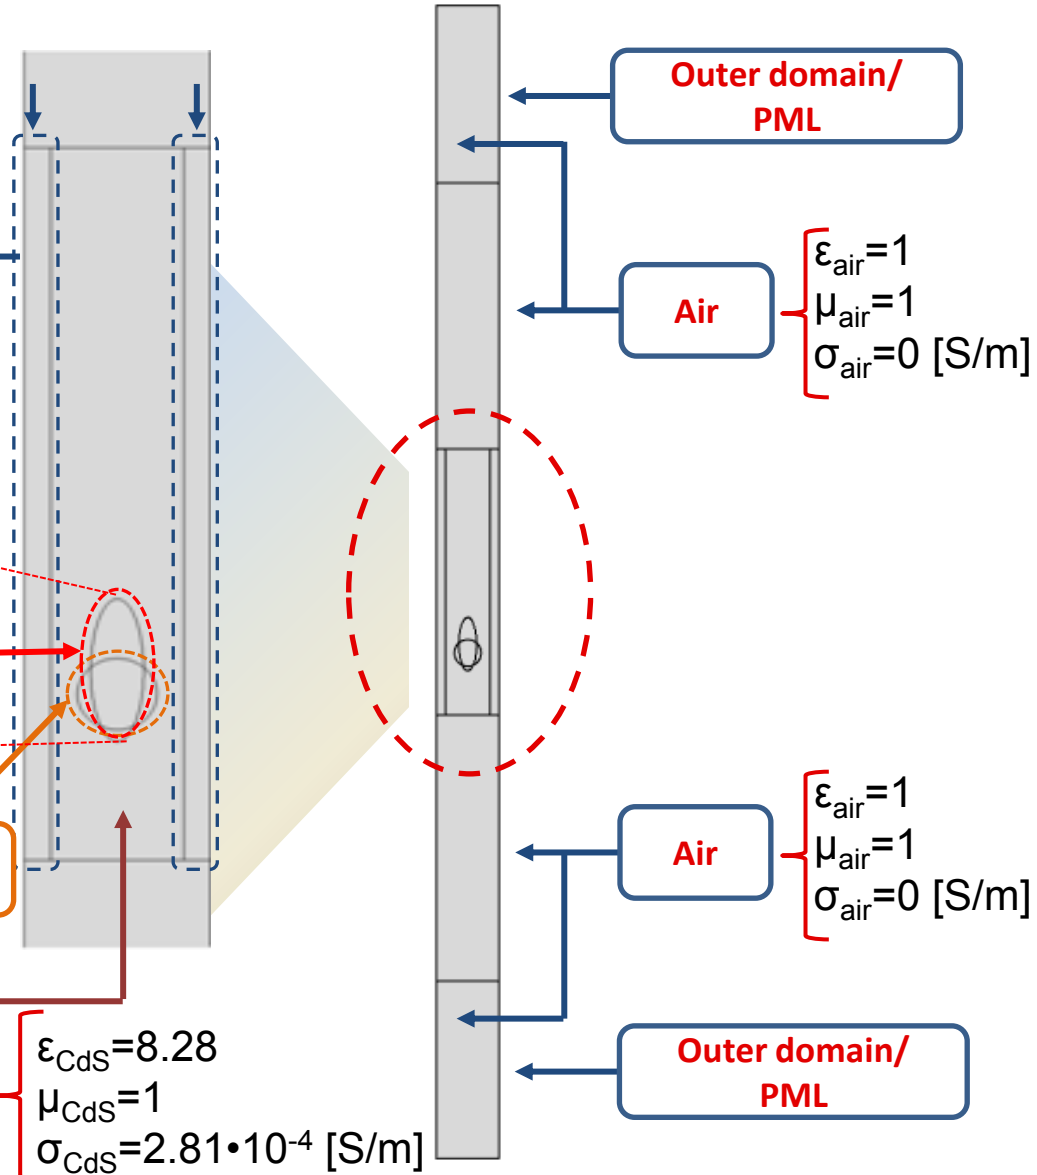

Air

$$\begin{aligned} \epsilon_{\text{air}} &= 1 \\ \mu_{\text{air}} &= 1 \\ \sigma_{\text{air}} &= 0 \text{ [S/m]} \end{aligned}$$

Air

$$\begin{aligned} \epsilon_{\text{air}} &= 1 \\ \mu_{\text{air}} &= 1 \\ \sigma_{\text{air}} &= 0 \text{ [S/m]} \end{aligned}$$

Outer domain/
PML

Localized charges have been set-up to mimic the promotions of electrons and an electrostatic simulation was launched. The resulting displacement field \mathbf{D} has been used to modify material parameters for electromagnetic interactions

Physics modeling

First Step: Electrostatic

Displacement Field
[C/m²]

▼ 3.6068×10⁻⁶

$$\begin{cases} \nabla \cdot \vec{D} = \rho \\ \vec{E} = -\nabla V \end{cases}$$

Negative Space Charge

Positive Space Charge

Ground
V=0

Continuity periodic condition

Only materials permittivity is requested for the electrostatic simulations

Ground
V=0

The calculated electric displacement modifies CdSe and CdS* conductivity and thus the interaction with the impinging electromagnetic wave

Physics Interaction

Displacement Field [C/m²]

$$\tau = 1fs$$

$$m_e = 9.11 \cdot 10^{-31} Kg$$

$$e = 1.6 \cdot 10^{-19} C$$

$$\sigma = \frac{ne^2\tau}{m_e}$$

Second Step: Electromagnetic

$\epsilon_{CdSe} = 9.29$
 $\mu_{CdSe} = 1$
 $\sigma_{CdSe} = \text{Charge dependent}$

$\epsilon_{CdS^*} = 8.28$
 $\mu_{CdS^*} = 1$
 $\sigma_{CdS^*} = \text{Charge dependent}$

CdSe

CdS*

Electric Field [V/m]

EM Wave

We have calculated with COMSOL the magnitude of the electric field vector E of a plane electromagnetic wave polarized in x-direction and traveling in y-direction at a wavelength of 514 nm in an array with, and without, localized charges

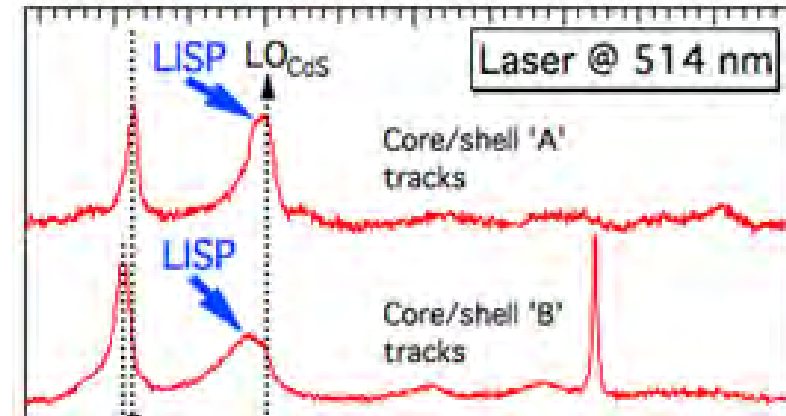

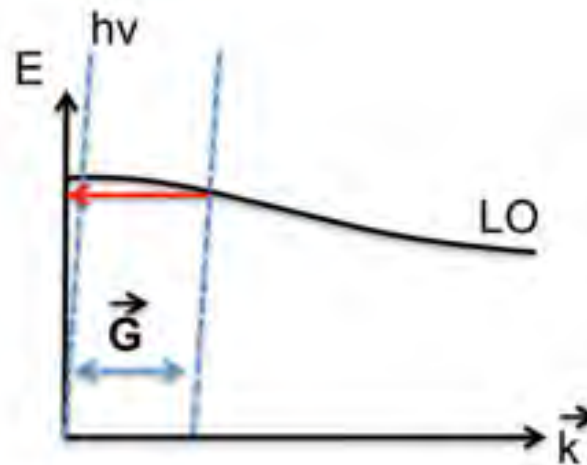

Results

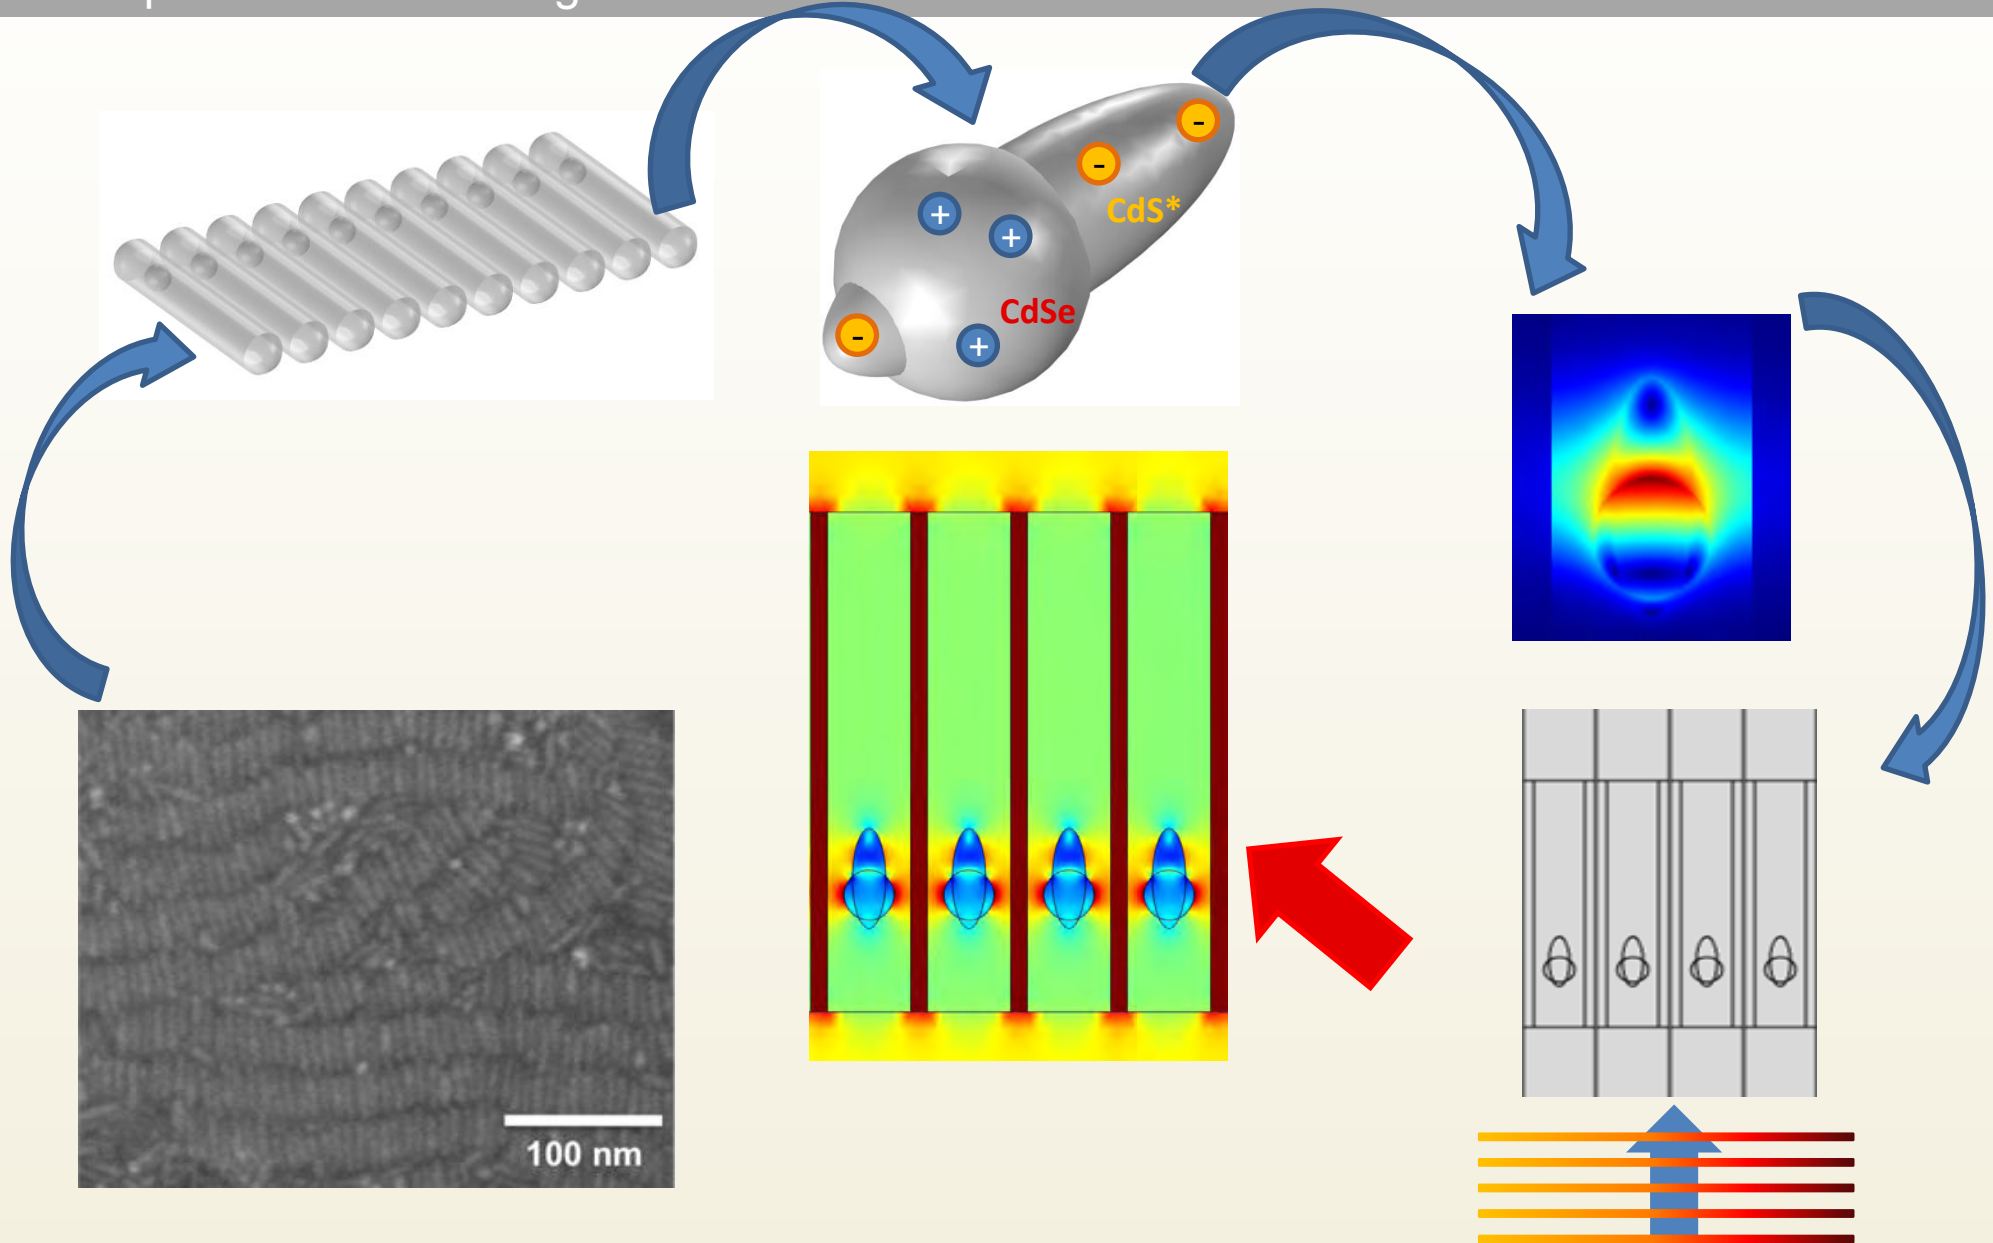

E field – [V/m]

E field – [V/m]

Starting from experimental results we modeled and calculated the interaction of an electromagnetic wave with our system combining electrostatics and electrodynamics to mimic photo-induced charges in the media
